Block Party

Fill each region with the digits 1 through N , where N is the number of cells in the region.
If an integer K is written in a cell, that means that the nearest value of K (looking only horizontally or vertically) can be found exactly K cells away.

Once the grid is completed, take the largest "horizontally concatenated number" from each region and compute the sum of these values*. Enter this sum as your answer. Good luck!

(*This is similar to the answer computation from our May 2017 puzzle. Also, it is demonstrated in the Example below.)

Example grid

Completed grid

3	2	4	3	2
1	3	2	1	3
1	2	1	1	2
1	1	2	3	1
1	2	4	2	1

Example answer:
 $32 + 43 + 13 + 12 + 1 + 2 + 1 + 123 + 12 + 21 = 260$

A Jane Street puzzle. Fill each region with the numbers 1 through N , where N is the number of cells in the region. For every number K in the grid, the nearest K via taxicab distance must be exactly K cells away.

Solution

Using the Python code below, which makes use of the Z_3 library, we obtain the solution shown.

Block Party Puzzle Solution

3	4	1	1	3	1	2	3	2
2	5	2	4	2	1	5	4	3
1	1	3	6	4	3	2	1	4
3	2	1	1	5	3	4	1	2
5	4	1	2	2	5	1	1	3
1	2	3	4	1	1	2	3	2
1	6	1	2	2	3	5	6	4
3	2	1	3	1	1	4	1	1
2	4	2	6	5	4	2	3	2

Python code

```

from z3 import *
import random
from matplotlib import pyplot as plt
